Research interests

My main research consists in applying methods from *analytic combinatorics* and *computer algebra* to the study of *random discrete structures*. I am particularly interested in the study of topological graphs, tree-like structures and lattice paths. Another topic of interest is the design of *fixed-parameter tractable algorithms* to efficiently solve *NP*-Hard problems. I also like *extremal problems* on combinatorial structures, in particular those expressed in terms of *positional games*.
